 var previousNode, nextNode, boundaryPosition, boundaryNode;
```

## Source Code WebJasaJahit-MVC

```
// Move the working range through the container's children, starting at the end and working backwards,
until the
// working range reaches or goes past the boundary we're interested in
do {
 containerElement.insertBefore(workingNode, workingNode.previousSibling);
 workingRange.moveToElementText(workingNode);
} while ((comparison = workingRange.compareEndpoints(workingComparisonType, textRange)) > 0 &&
 workingNode.previousSibling);

// We've now reached or gone past the boundary of the text range we're interested in
// so have identified the node we want
boundaryNode = workingNode.nextSibling;

if (comparison == -1 && boundaryNode && dom.isCharacterDataNode(boundaryNode)) {
 // This is a character data node (text, comment, cdata). The working range is collapsed at the
start of the
 // node containing the text range's boundary, so we move the end of the working range to the
boundary point
 // and measure the length of its text to get the boundary's offset within the node.
 workingRange.setEndPoint(isStart ? "EndToStart" : "EndToEnd", textRange);

 var offset;

 if (/[\\r\\n]/.test(boundaryNode.data)) {
 /*
 For the particular case of a boundary within a text node containing line breaks (within a <pre>
element,
 for example), we need a slightly complicated approach to get the boundary's offset in IE. The
facts:

 - Each line break is represented as \\r in the text node's data/nodeValue properties
 - Each line break is represented as \\r\\n in the TextRange's 'text' property
 - The 'text' property of the TextRange does not contain trailing line breaks

 To get round the problem presented by the final fact above, we can use the fact that
TextRange's
 moveStart() and moveEnd() methods return the actual number of characters moved, which is not
necessarily
 the same as the number of characters it was instructed to move. The simplest approach is to use
this to
 store the characters moved when moving both the start and end of the range to the start of the
document
 body and subtracting the start offset from the end offset (the "move-negative-gazillion"
method).
 However, this is extremely slow when the document is large and the range is near the end of it.
Clearly
 doing the mirror image (i.e. moving the range boundaries to the end of the document) has the
same
 problem.

 Another approach that works is to use moveStart() to move the start boundary of the range up to
the end
 boundary one character at a time and incrementing a counter with the value returned by the
moveStart()
 call. However, the check for whether the start boundary has reached the end boundary is
expensive, so
 this method is slow (although unlike "move-negative-gazillion" is largely unaffected by the
location of
 the range within the document).

 The method below is a hybrid of the two methods above. It uses the fact that a string
containing the
 TextRange's 'text' property with each \\r\\n converted to a single \\r character cannot be longer
```

## Source Code WebJasaJahit-MVC

than the

character at

good

```
 text of the TextRange, so the start of the range is moved that length initially and then a
 a time to make up for any trailing line breaks not contained in the 'text' property. This has
 performance in most situations compared to the previous two methods.
```

```
 */
 var tempRange = workingRange.duplicate();

 * Sandbox for executing javascript, parsing css styles and doing dom operations in a secure way
 *
 * Browser Compatibility:
 * - Secure in MSIE 6+, but only when the user hasn't made changes to his security level "restricted"
 * - Partially secure in other browsers (Firefox, Opera, Safari, Chrome, ...)
 *
 * Please note that this class can't benefit from the HTML5 sandbox attribute for the following reasons:
 * - sandboxing doesn't work correctly with inlined content (src="javascript:<html>...</html>")
 * - sandboxing of physical documents causes that the dom isn't accessible anymore from the outside
(iframe.contentWindow, ...)
 * - setting the "allow-same-origin" flag would fix that, but then still javascript and dom events refuse to
fire
 * - therefore the "allow-scripts" flag is needed, which then would deactivate any security, as the js
executed inside the iframe
```

## Source Code WebJasaJahit-MVC

 * Creates the sandbox iframe
 *
 * Some important notes:
 * - We can't use HTML5 sandbox for now:
 * setting it causes that the iframe's dom can't be accessed from the outside
 * Therefore we need to set the "allow-same-origin" flag which enables accessing the iframe's dom
 * But then there's another problem, DOM events (focus, blur, change, keypress, ...) aren't fired.
 * In order to make this happen we need to set the "allow-scripts" flag.
 * A combination of allow-scripts and allow-same-origin is almost the same as setting no sandbox
 * attribute at all.
 * - Chrome & Safari, doesn't seem to support sandboxing correctly when the iframe's html is inlined (no
 * physical document)
 * - IE needs to have the security="restricted" attribute set before the iframe is
 * inserted into the dom tree
 * - Believe it or not but in IE "security" in document.createElement("iframe") is false, even
 * though it supports it
 * - When an iframe has security="restricted", in IE eval() & execScript() don't work anymore
 * - IE doesn't fire the onload event when the content is inlined in the src attribute, therefore we rely
 * on the onreadystatechange event
